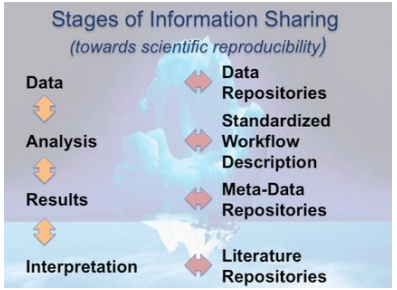
Best Practices for Biomedical Research Data Management

Module 9: Scientific Research Team Working with Librarians

Dr. David Kennedy, PhD, UMass Medical School



This video will review, from the researcher perspective, a supplemental grant that funded a librarian (informationist) to utilize their skills and expertise to establish best practices and standards around data sharing in the discipline of neuroimformatics so that it becomes possible to “generate accurate, easy to obtain quantitative metrics” that give credit to the original source of data.

Introduction

- Since even before kindergarten, there have always been libraries and librarians in our lives
- I only first heard the term 'Informationist' in the summer of 2013, when running across a NIH program announcement: NLM Administrative Supplements for Informationist Services in NIH-funded Research Projects (Admin Supp)
  - "These administrative supplements provide funds to supported research and center grants in order to enhance the storage, organization, management and use of electronic research data through the involvement of informationists, also known as in-context information specialists.
  - The purposes of this administrative supplement program are (1) to enhance collaborative, multi-disciplinary basic and clinical research by integrating an information specialist into the research team in order to improve the capture, storage, organization, management, integration, presentation and dissemination of biomedical research data; and (2) to assess and document the value and impact of the informationist's participation.

Supplement to ‘CANDIShare’ Grant

- Main Grant Objectives:
  1. Expand Neuroimaging data sharing within the Child Psychiatry community
  2. Create a Child Psychiatry-centered portal to integrate resources and enhance data discovery within the community
  3. Perform novel investigation into the neurobiological underpinnings of child psychiatric disorders
- Supplement Objectives
  - To utilize the skills and expertise of an informationist to establish best practices and standards around data sharing in the discipline of neuroimformatics so that it becomes possible to “generate accurate, easy to obtain quantitative metrics” that <u>give credit to the original source of data</u>.

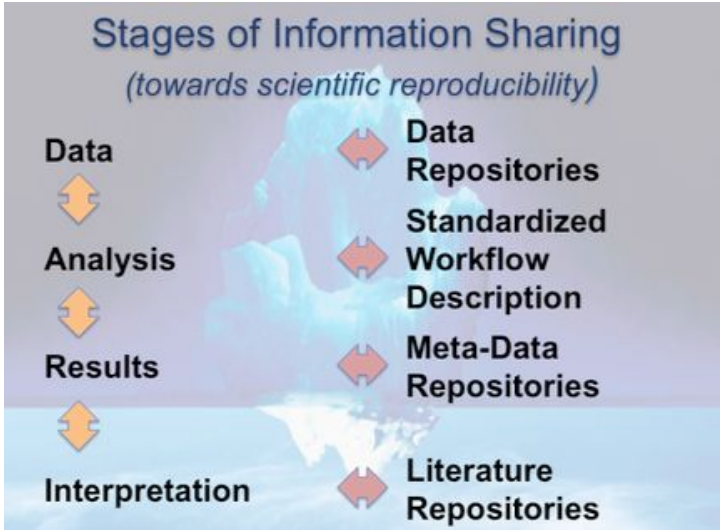
  1. Create a data-set (i.e. subject’s MRI image) level unique identifier
  2. Develop ‘best practices’ for generating and including the data sources associated with a publication
  3. Develop a procedure to derive credit and usage reports for shared data
  4. Evaluate the contributions of the informationist to the parent project.

Assessment
(from the researchers perspective)

Did we:

- Discover and learn what skills librarians can offer to research project teams?
- Integrate an informationist/librarian into the research team and define roles and expectations?
- Effectively bring an informationist/librarian up to speed on the research project and its aims?

- Yes!

The ‘new’ library transcends a specific space (room, building), or a specific information type (printed word).


The ‘digital word’, at least in scientific scholarship, is where the information really is.
