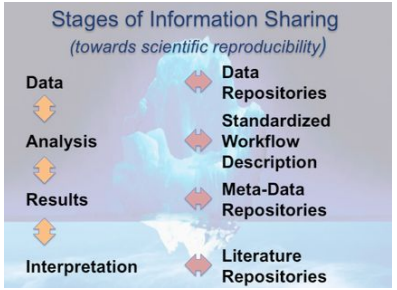
Best Practices for Biomedical Research Data Management

Module 9: Scientific Research Team Working with Researchers

Leah Honor, MLIS, UMass Medical School



This video will review, from the librarian perspective, a supplemental grant that funded a librarian (informationist) to work with a research team to develop best practices in uniquely identifying data sets so that credit can be given to original sources when the data are shared and shared usage can be measured.

Working with Research Teams

- What can a librarian add to a research team?
  - Some obvious things: information organization, data management, resource discovery…
  - Others less so: Copyright and intellectual property information, grant writing/compliance assistance...

Working with Research Teams

- What can a librarian gain from working with a research team?
  - Subject expertise
  - Foster collaborations and further partnerships
  - New perspective - it can be interesting to see how the library is viewed from the outside, what needs are not currently being met

Liaison Librarians

- Centralized
- Primary expertise in Librarianship - subject expertise helpful
- Can be liaison to multiple groups
  - Does not need to be face to face, or even synchronous interaction, i.e. LibGuides

Embedded Librarians

- Decentralized (usually)
- Subject specialists, as well as information professionals
- Where can they be embedded?
  - Departments
  - Curricula or classes
  - Online learning environments

Informationists

- Location independent - can be done from anywhere
  - often depends on the research team
- Expertise developed and tailored to the team
- Project based, usually one at a time - NIH funded supplements to previously awarded research grants
